~Create a virtual network.
Then create Frontend VM and Backend VM - both VMs will be in the VPN
From 2 terminals, connect one to the frontend public IP and one to the backend public IP
By typing
Ssh -i frontend_key.pem azureuser@<IPAddressPublicFrontend>

If error
chmod 400 <Frontend_key.pem>

On both machines

Sudo apt update
Sudo apt install nginx

Git clone <htpps://……..>
cd into the folder that is to be deployed
And go to the frontend in one terminal and the backend in the other.

Sudo apt install npm - this installs Node.js also, but then there is a version problem.
Hence
Sudo apt remove nodejs -y
Sudo apt autoremove -y
Curl -fsSF https://deb.nodesource.com/setup_22.x | sudo -E bash -
Sudo apt install nodejs -y
Again, install frontend dependencies

Now we will build the frontend.

Nano .env - VITE_API_URL=
For reverse proxy, keep this empty only.

Npm i
{
Now reverse proxy setup on VM1 (only)
sudo nano /etc/nginx/sites-available/default
Cut out all the parts and add only the server waala part from the file
}*****

Reload nginx
Sudo systemctl restart nginx
Sudo systemctl status nginx

Copy frontend files to /var/www/html
sudo rm -rf /var/www/html/*
sudo cp -r dist/* /var/www/html
npm run build

Do till here if only asked for a static website
Also note that the ***** part marked above is also not needed

Now backend
Set inbound rule for Azure in the backend of Azure - PORT = 5000

Now, on our website (static) - on console - window.location.origin, and copy this.

Now, create a .env for the backend and paste the content from GitHub
And make sure to change the CLIENT_URL=http://40.81.226.218
This we'll get from the copied content above

Npm i
Npm start

Done
